FinNews AI: AI-Powered Financial News Simplifier

Project Description :-

SaveIQ AI is a goal-based saving tracker designed to help users organize their savings and work toward personal financial goals in a clear and structured way. Users can define a savings goal, set a target amount, record contributions and monitor how much progress they have made over time. The platform is intended to make saving easier to understand and manage, especially for students and people beginning to build healthy money-management habits.

The application brings savings goals and progress information together in a single dashboard. Visual progress indicators and charts help users understand their saving activity, while goal details provide a convenient way to review targets and contributions. SaveIQ focuses on making the saving process simple, trackable and motivating rather than presenting users with complicated financial information.

The website is built using a modern web application stack and is designed to provide a responsive experience across desktop and mobile screens. Its project structure includes a Next.js application, Supabase integration and supporting UI libraries. Environment variables are used for configuration values so that sensitive service credentials are not placed directly in application code.

Technology & AI :-

Frontend: Next.js / React / TypeScript / HTML / CSS

UI & Styling: Tailwind CSS / Framer Motion / Lucide React

Backend & Data Services: Supabase

Charts & Visualization: Recharts

Form Handling & Validation: React Hook Form

Deployment: Github

Security: Environment variables for service configuration and API credentials

Key Features :-

- Sign-in screen for accessing the SaveIQ interface
- Separate goal pages for savings targets such as a laptop, watch and emergency fund
- Goal summaries showing target amount, saved amount, remaining amount and progress
- Contribution entry area for recording money added to a selected goal
- Savings-plan section displayed on the laptop goal page
- Contribution history view for reviewing savings activity
- Savings calendar for viewing savings activity by date
- Navigation and dashboard layout for reviewing multiple goals in one place
- Technology and backend integrations listed in the project setup documentation; these are not all verifiable from the video alone

Scenarios :-

Scenario 1: Saving for a laptop. The user opens the laptop goal page, reviews the target and current savings figures, and uses the contribution area to record money toward the goal. The interface shows the savings progress and a section labelled as a saving plan.

Scenario 2: Managing different goals. The user opens separate goal pages, including the watch and emergency fund shown in the video, and reviews the amounts and progress associated with each goal.

Scenario 3: Reviewing contribution history. The user opens the "Your history" screen to review recorded savings activity and the related goal information.

Scenario 4: Checking the savings calendar. The user opens the savings calendar to view savings activity by date. The calendar screen uses date-based cells and visual markers to help the user review activity across the month.

Milestones :-

Milestone 1 – Project Planning & Requirement Analysis

Identify the intended users and savings-tracking requirements, then plan the sign-in, goal details, contribution entry, history and calendar workflows demonstrated in the video.

Milestone 2 – User Interface & Goal Management

Build the sign-in screen and the goal interface, including the laptop, watch and emergency-fund pages, with clear savings summaries and navigation.

Milestone 3 – Data Integration & Contribution Tracking

Implement the goal and contribution data workflow so that users can record contributions and review goal-related savings activity. Supabase is listed in the project documentation.

Milestone 4 – Progress Visualization & Validation

Present savings progress and history through goal summaries and the savings calendar. The video also shows a saving-plan section on the laptop goal page.

Milestone 5 – Testing, Optimization & Deployment

Check the sign-in, goal, contribution, history and calendar screens; test layout and data behaviour; configure environment variables and deployment as applicable to the project setup.

Conclusion :-

SaveIQ AI presents a goal-based savings interface with separate pages for savings goals, contribution entry, a savings-plan section, contribution history and a calendar view. The video demonstrates how a user can review different goals, inspect savings figures and navigate through savings activity. The documented technology stack describes the intended implementation, while the visible video is evidence of the user interface and workflow rather than proof of every backend or deployment detail.

Expected Outcome :-

The expected outcome is a user-friendly savings tracker where users can review goals such as a laptop, watch or emergency fund, record contributions, inspect their history and view savings activity on a calendar. Goal summaries and progress indicators are intended to make savings progress easier to understand.
